

Golang Project

PROGRESS REPORT #8

Created functions for publishing items on the web site.

1. “addItemFormHandler” displays a form for adding a new item.
2. “addItemSubmitHandler” parses the form data submitted by the user
3. “itemsHandler” displays a list of all the items

When the user submits the form to add a new item, the addItemSubmitHandler parses the form data and creates a new Item struct, which it adds to the items list. It then redirects the user back to the list of items.
