

# Golang Project

## PROGRESS REPORT #9

Created functions for purchasing items on the web site.

1. “CheckoutHandler”: adds an item to the cart when the user clicks the "Add to Cart" button.
2. “ConfirmHandler”: displays the order confirmation page and saves the order to the database.
3. In the “CheckoutHandler” function, we extract the `item_id` form value from the HTTP request and use it to retrieve the corresponding `Item` object. Then, we set a cookie to remember the item added to the cart and redirect the user to the order confirmation page
4. In the “ConfirmHandler” function, we iterate over all cookies in the HTTP request and extract the items added to the cart. We then display the order confirmation page with a list

In the future it is planned to connect all services to the database.
